

# Alma Recurrent Global Natural Resources Fund

Data as of  
29 September 2023

Fund AUM  
\$83,000,709

Fund Launch  
29 June 2018

ALMA CAPITAL

## Investment Strategy

- Fund's investment objective is to seek total return by investing in global natural resource-related companies.
- Typical industries in which the fund invests are energy, basic materials, infrastructure, transportation and logistics.
- The fund may invest in companies of any market size capitalization, including IPOs.
- The investment process incorporates macroeconomic and commodity supply/demand factors with fundamental company analysis.

## Investment Manager - Recurrent <sup>(1)</sup>

- SEC-registered Houston-based independent investment advisor founded in 2017, with \$800m in AUM.
- Portfolio is managed by Mark Laskin and Bradley Olsen, founders of the firm, who both worked at BP Capital Fund Advisors and have extensive experience in energy investing.
- Specialised in energy and natural resources investment.

## Commentary - Recurrent - September 2023 <sup>(6)</sup>

### Performance Review

During the month of September 2023, the Alma Recurrent Global Natural Resources Fund fell -0.22% net of fees, less than the S&P Global Natural Resources Index's -0.42% fall. The portfolio's overweight in energy significantly contributed to relative performance, as the industry was one of few areas of the market benefiting from positive absolute performance. Stock picking in the portfolio's aluminum and steel sectors detracted from performance, as economic forecasts weakened operational outlooks for portfolio companies.

### Investment Discussion

Historically, oil project economics focused on "cost of supply" as the primary unit of measure. However, the increased cost of capital - driven by ESG and divestment movements - along with the longer-term potential for oil obsolescence required a change in project economics, with a greater emphasis on "time". As a result, the industry has shifted from megaprojects with long lead times and low costs per barrel, to "short cycle" projects with short lead times and higher costs per barrel. This is driven by a focus on returns (IRRs), instead of cost-based metrics (NPVs), incorporate not only a project's cost inputs but also the time value of money. Our 1Q 2022 white paper titled "The Twilight of the Energy Transition Becomes a New Dawn for Shale", we outlined why shale production, as the premier global short-cycle production, would counterintuitively increase in relevance rather than decrease. Although shale ranks poorly on a cost-per-barrel basis, its uniquely short time-to-production would prove shale to be an increasingly valuable contributor to the global oil production mix, regardless of global demand. In early October, ExxonMobil (XOM) announced the acquisition of Pioneer Natural Resources (PXD) a ~\$60 Billion transaction. In the past, ExxonMobil has made notable shale acquisitions, from the 2009 acquisition of XTO Energy to the 2017 acquisition of 275,000 Permian acres from the Bass family. XOM regularly makes acquisitions, but this time the language was different regarding three topics:

#### 1) Short-cycle assets.

*"To put this merger into context, our exposure to short-cycle barrels will increase to over 40% of our Upstream portfolio, from 28% today" - Exxon CEO Darren Woods, on the call announcing the PXD acquisition*

While much of the language outlining the Pioneer acquisition mirrored past acquisitions, the messaging with the Pioneer acquisition added noteworthy language. The second bullet point of the presentation notes that the Pioneer operations "transforms ExxonMobil's Upstream portfolio" by "increasing short-cycle capital flexibility". Throughout the presentation, ExxonMobil notes the value of "short-cycle" production, including the fact that short cycle barrels will comprise 40% of the combined upstream portfolio by 2027. The first paragraph of our 2022 white paper summarizes XOM's rationale to buy PXD:

*"Contrary to traditional supply-demand economics, oil projects are no longer focused on finding the cheapest barrels - the focus is now on high return barrels with the quickest paybacks. Defying many skeptics, Shale will represent a growing share of global supply growth in the next decade."*

#### 2) Capital flexibility.

*"...this increased short cycle opportunity comes with even greater capital and operational flexibility" - XOM CEO Darren Woods, PXD conference call*

One of the most desirable attributes of US Shale production is not only its "short cycle", but also its small unit size per well. Whereas offshore projects require significant capital over many years - usually measured in the hundreds of millions of dollars - to bring an entire project online, shale wells are much smaller in scope. The combination of small unit size and short cycle allow operators to more finely tune the amount of capital to allocate, which can be increased or decreased as energy market conditions warrant.

#### 3) Capital efficiency.

While not as much a point of focus, on the conference call XOM management alluded to the concept of "capital efficiency". Over time, one of the most difficult challenges energy companies face is "fallow capital", which is inherent to reinvesting in large oil projects. At large oil companies, most capital projects take many years to complete and subsequently earn profits. Large percentages of invested capital do not earn a return during years of planning and construction, causing "capital inefficiency". XOM management's discussion of shale's "capital efficiency" focused on the idea that capital invested would deliver a return in months, rather than years or decades. For a large company undertaking capital intensive projects, having a large and "capital efficient" portion of the portfolio would be a desirable attribute, especially as concerns about the energy transition persist.

While XOM outlined positive attributes of short cycle shale production, there are drawbacks as well. Notably, Shale is quicker to ramp production, and quicker to fall, requiring higher sustained CAPEX to maintain production. As we have noted in multiple white papers, shale production is quick to ramp, but also declines 70% in the first 12 months, and 20-40% annually for the next 5-6 years. In comparison, most long-term projects take years to first production and upon reaching peak production, decline at a 5-10% annual rate. As we wrote in February 2022:

*"One clear implication, in our view, is that increased dependence on Shale means that more maintenance drilling will be required to offset Shale's hyperbolic declines, requiring increased drilling capex even in the event of long-term demand destruction."*

Importantly, the oil price must consistently remain high enough to incentivize higher cost shale production, despite the potential for falling oil demand. As one of the highest cost sources of oil production with short cycle production, oil companies make capital spending decisions using relatively short-term oil price signals. This is different than conventional oil market interpretations. While in a traditional economic supply/demand construct, if global oil demand falls, volume and therefore price would fall. However, when incorporating time as a key decision variable, the shale production cycle is so short that the oil price must remain high enough to incentivize the constant reinvestment required to keep shale production flat.

As the headline of XOM acquiring PXD crossed the wires, many investors assumed future XOM/PXD synergies would be key to the deal's success. Management commentary, however, focused on a broader strategic portfolio realignment, highlighting the unique attributes shale's short cycle production bring to XOM's portfolio, as we highlighted in our 2022 white paper.
